Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Data quality, concepts and methodology	
Major drainage area and sub-drainage area geography	186

Introduction

Canadians' health and their social and economic wellbeing are fundamentally linked to the quality of their environment. Recognizing this, the Government of Canada has committed to reporting national indicators of air quality, greenhouse gas emissions and freshwater quality. The goal of these indicators is to provide Canadians with more regular and consistent information on the state of their environment and how it is linked with human activities.

This *Socio-economic Information* module of the Canadian Environment Sustainability Indicators is intended to help users put the indicator results in context by providing information about some of the main forces driving the changes in the indicators. It draws on the social and economic information that Statistics Canada assembles through its many programs.

The main report, *Canadian Environmental Sustainability Indicators 2007*, no. 16-251-X, summarizes the key findings for the three indicators

Socio-economic information

Data for the *Socio-economic Information* module are divided into the categories below and are presented along with key highlights. Where possible, they are presented back until the early 1980s. Data are presented for different spatial levels: the nation, the provinces and territories and drainage areas,¹ which are particularly useful for analyzing how human activities may affect water. The level of spatial aggregation offered depends on the characteristics of the source data.

Land cover

Land cover describes the physical features found on the surface of the land and describes the type of environment at a particular location. It is a determinant of many processes related to trends in the environmental sustainability indicators, including soil erosion, habitat, carbon sequestration and others.

Canada's territory is vast and varied, ranging from the mountains and prairies of the west to the rivers and lowlands of the east and the tundra of the north (map 1). In total, the nation comprises some 10 million square kilometres (table 1).

Forests cover 38% of Canada's land mass. Barren areas and areas with low vegetation cover another 26% of the total, while shrubland and cropland comprise 10% and 7% respectively. Disturbance areas, snow and ice and other land cover areas account for the remainder (table 1). Summary data on land cover are presented below. The map and table provide estimates of land cover types for both major drainage areas and sub-drainage areas.

A very small proportion of Canada's total land area is devoted to urban uses. However this area has grown very rapidly. Between 1971 and 2001, urban areas in Canada grew by 15 thousand square kilometres, an increase of 96% (chart 1).

Table

1 Land cover by category, by major drainage area and sub-drainage area, 2000

1. Drainage areas are natural geographic units defined by the boundaries between river systems. For details on the drainage area framework, please see *Data quality, concepts and methodology — Major drainage area and sub-drainage area geography*.

Population

Population characteristics influence the pressures that Canadians place on the environment. For example, with growing numbers of people living in and around urban areas, the potential for impacts on local and regional air and surface water quality are multiplied.

Population size, distribution and density partly determine the impacts that human activities have on the environment. Between 1980 and 2006, Canada's population grew by 33%, from 24.5 million to 32.6 million people (table 2).

Canada, with 3.5 people per square kilometre, has one of the lowest population densities in the world (table 3); however, Canadians increasingly live in urban centres, most of which are located in a relatively narrow strip along the Canada-U.S. border. This has had consequences for urban air quality. From 1981 to 2006, urban populations increased by 38% while rural populations increased by 6% (chart 3).

Aquatic ecosystems in drainage areas where populations are highly concentrated may also experience increased stress from wastewater discharges and other uses. In 2006, 63% of Canadians lived in the St. Lawrence major drainage area, whose waters feed into the Great Lakes and St. Lawrence River (table 4). Population densities in the drainage area are among the highest in Canada (table 5).

Population estimates and basic population characteristics from the Census of Population are presented below by province and territory and for sub-drainage areas across Canada.

Health

Canadians largely think of themselves as healthy people: compared with people in most other countries, we live longer and suffer from fewer chronic illnesses and disabilities as we age.² Life expectancy at birth stood at 80.2 years in 2004 (table 13), almost two years higher than the OECD average,³ and the longest it has ever been.

Human health is influenced by many interacting factors such as age, sex, place of residence, and socio-economic status, all of which can have a notable impact on well-being. Individual behaviours, genetics and environmental factors, such as temperature extremes and air or water pollution can also have an impact on health. Air pollution can aggravate respiratory conditions, especially for those suffering from lung infections, bronchitis, emphysema and asthma.

In 2005, 8% of Canadians over the age of 12 had been diagnosed with asthma (table 10). In the same year, 32% of Canadian households were aware of poor air quality advisories in their area. Of these households, 39% made changes to their activity or routine because of the advisory (table 14).

Chart 6
Cancer incidence^{1,2}

rate per 100,000 population

1. Cancer incidence rates are age-standardized using the direct method and the 1991 Canadian Census population structure. The use of a standard population results in more meaningful incidence rate comparisons, because it adjusts for variations in population age distributions over time and across geographic areas.
2. The Canada, provincial and territorial totals for all cancers diagnosed between 1976 and 1991 exclude approximately 197,500 cases of non-melanoma skin cancer (International Classification of Diseases, Ninth Revision (ICD-9 173)).

Source(s): CANSIM table 103-0204.

Chart 7
Life expectancy¹ at birth

1. Life expectancy is the number of years a person would be expected to live, starting at birth (for life expectancy at birth) or at age 65 (for life expectancy at age 65) if the age- and sex-specific mortality rates for a given observation period (such as a calendar year) were held constant over the estimated life span.
Source(s): CANSIM table 102-0511.

Gross domestic product, employment and international trade

The environment is an essential backdrop for economic activity. Not only do we extract raw materials and energy from it, but the environment also serves as a repository for the wastes produced by economic activity. Growth in economic activity brings benefits in the form of increased income, but can also lead to increased pressure on the environment.

Gross output, which measures the total value of production, reached \$2.5 trillion in 2004 (table 20). An alternate, more commonly used measure of economic output—real gross domestic product (GDP)—measures the unduplicated value of all goods and services produced in Canada corrected for inflation. Real GDP increased by 98% from 1981 to 2006 (table 18).

The structure of the economy and distribution of activities across the country help to explain trends in the indicators both nationally and regionally. Each industry has different impacts in terms of water usage, emission of pollutants and greenhouse gases. Service industries (trade, transportation, travel and communications) made up just over two-thirds of Canada’s GDP in 2006; goods-producing industries, (manufacturing, construction and resource industries) accounted for the remainder (table 19).

Energy, industrial goods such as metal ores, metals, chemicals and fertilizers, forestry and agricultural products account for an important share of Canada’s exports. Boosted by recent strength in commodity markets, the proportion of these goods in total exports rose to 54% in 2006, with energy leading the way (table 23).

The tables below provide basic information about Canada’s economy—gross output, gross domestic product, labour force characteristics and international trade.

Tables

18 Gross Domestic Product (GDP), expenditure-based, by province and territory

19	Gross domestic product (GDP), by industry
20	Gross output, by industry
21	Labour force characteristics
22	Labour force, by province
23	Merchandise trade, by sector, balance of payment basis

Energy

Few other activities are as important to the economy as the production and consumption of energy. At the same time, these activities have a wide range of environmental impacts. Effects include emissions of greenhouse gases and airborne contaminants such as nitrogen oxides, sulphur oxides and particulate matter, and the disruption of rivers and lakes for hydroelectric power generation and for cooling purposes at thermal generating stations.

From 1981 to 2005, primary energy production doubled to 16.6 million terajoules, largely as a result of increases in the production of natural gas and crude oil. Primary electricity production (from hydro and nuclear sources) increased 48% (table 24). In 2006, 60% of electric power was generated from hydro power, 16% from nuclear sources, while the remainder was produced using fossil fuels through conventional steam and combustion generation (chart 9).

Total energy use increased 23% from 1990 to 2002 to 10.3 million terajoules, with the business sector responsible for the largest part of the increase. The electric power generation, transmission and distribution industry accounted for 22% of energy usage for the business sector, followed by the oil and gas extraction industry (14%) and the transportation industries⁴ (12%) (table 29).

In 2002, four industry groups including manufacturing, utilities, mining and oil and gas extraction, and transportation and warehousing, accounted for over 73% of total industrial energy use.⁵ Using a measure of energy use per unit of real gross output to calculate the intensity of energy use, two of these industries improved their performance—by using less energy for each unit of output. In 2002, the manufacturing industry used 33% less energy per unit of real gross output compared with 1990. The transportation and warehousing industry decreased its use of energy per unit of real gross output by 15% over the same period (chart 10). However, because real gross output increased considerably between 1990 and 2002, absolute energy use increased over the period for each of these four industries (chart 11), despite the downward trend in energy use per unit of real gross output for the manufacturing and transportation industries.

Households contribute to air and greenhouse gas emissions through the use of electric power, home heating fuels and gasoline and diesel. The household sector uses close to a fifth of the energy consumed in Canada (table 29).

The type of energy used by households for home heating has changed over the last several decades. Between 1981 and 2003, the proportion of households heating their homes with oil fell from 34% to 13%. Meanwhile, the proportion of households heating their homes with natural gas rose from 42% to 50%, while the proportion heating with electricity rose from 21% to 33% (chart 13). Compared to oil, heating with natural gas or electricity (when produced with low emission technologies such as nuclear and hydro power) produces fewer greenhouse gas emissions⁶ and air pollutants.⁷

After energy use in the home, transportation is the biggest contributor to households' demand for energy (table 29). It is also the largest contributor to households' greenhouse gas emissions (table 33). Between 1990 and 2005, Canadians use of gasoline and diesel fuel increased significantly. In 2005, the volume of gasoline sold at the pump decreased by 1% from the previous year, the first decline in a decade. However, sales increased by 23% over 1990,

4. Includes only those establishments that derive their primary revenue from transportation activities. This combines the 1997 North American Industry Classification (NAICS) codes 481 to 488.

reaching 36.2 billion litres. Retail pump sales of diesel increased 52% over the same period, reaching 4.6 billion litres (table 32).

Energy is also used by households to run a variety of other devices, including small gasoline engines that power equipment such as lawnmowers. These emit relatively high amounts of pollutants that can adversely affect air quality. In one year, the average gasoline-powered lawnmower emits as much PM_{2.5} as an average passenger car travelling about 3,300 km.⁸ In 2006, an estimated 67% of households owned a gasoline-powered lawnmower, 21% a snowblower and 5% a leafblower (table 35).

Transportation

Transportation keeps the economy moving by distributing goods and linking people in different communities and countries. However, transportation also contributes to environmental stresses, in part through the release of pollutants and greenhouse gas emissions.

Driving private vehicles remains the preferred means of personal transportation. In 2006, over 20.1 million road motor vehicles were registered for use in Canada (table 36). Vehicle choice has an important impact on air pollutant and greenhouse gas emissions. In general, cars are more fuel-efficient than larger SUVs, trucks and vans. In 2006, cars accounted for half (50%) of the total kilometres driven by light vehicles,⁹ followed by pickups (20%), vans (18%), SUVs (9%) and station wagons (3%) (table 37).

Choosing to drive less contributes to a healthier environment. In 2006, 73% of Canadians working outside the home travelled to work by motor vehicle, 14% walked or cycled and 10% used public transit during warmer months. During colder months, the proportion of commuters who travelled by car increased to 81% (table 38).

In Canada, the vast majority of goods are transported by water, rail and road. While freight transport has increased for all three modes, the trucking industry in particular has seen a dramatic rise, caused in part by the advent of just-in-time delivery. Since 1990, freight carried by the for-hire trucking industry increased 76%, from 174 million tonnes to 306 million tonnes in 2004 (chart 14).

Agriculture

Agricultural activity

Over the past several decades, Canadian crop and livestock operations have grown considerably, becoming larger and more specialized. Between 1981 and 2006, the number of farms decreased 28% (table 47), while cropland areas increased 16% (table 51). Farms have been getting larger. The average farm in 2006 was 3.0 square kilometres, compared with 2.1 square kilometres two and a half decades earlier (table 49).

Agricultural activities have the potential to impact the environment. Agricultural fertilizer use and improper manure management have been linked to high concentrations of nutrients such as nitrogen and phosphorus in some water bodies.¹⁰ Pesticides, used to control weeds, insects and other pests, can contaminate water through runoff and infiltration into groundwater and can potentially harm non-target organisms. Effects vary depending on the chemical used along with the level and duration of exposure.

From 1981 to 2006, real farm business expenditures on chemical products such as herbicides, insecticides and fungicides increased 121% (table 56), while spending on fertilizers increased 54% (table 58). Over the same period, fertilized areas increased 37% to 253,480 square kilometres, or 71% of the total area under crops (table 51 and table 59).

Some agricultural activities also contribute to emissions of methane and nitrous oxide, both potent greenhouse gases. The digestive systems of ruminants—including cattle—produce methane, which is a greenhouse gas. Methane is also produced when manure is stored under anaerobic conditions. Farmers had 15.8 million cattle and calves on agricultural operations in 2006 (table 54).

In 2001, cattle and other livestock produced 177.5 million tonnes of manure, with the largest amounts produced in drainage areas in southern Alberta, Ontario and Quebec (table 81).

The tables below include annual data on livestock and crop production, as well as data from the Census of Agriculture, presented both by province and by drainage area. These variables detail several aspects of farm practices potentially related to trends in the environmental sustainability indicators for air quality and, especially, water quality.

Manure production, 2001 - Mississippi River

Environmental management

Despite national efforts to protect the environment and reduce emissions of pollutants and wastes, industry is still a major source of greenhouse gas emissions and has an impact on air and water quality. Recognizing their impact on the environment, many firms have made significant efforts to invest in environmental protection.

Capital expenditures on environmental protection increased from \$1,734 million in 1998 to \$2,918 million in 2004. The petroleum and coal products industry contributed almost a third (32%) of the total expenditures on environmental protection in 2004, followed by the oil and gas extraction industry (19%) and the electric power generation industry (10%). End-of-pipe pollution abatement and pollution prevention processes accounted for more than three quarters of the total share of expenditures (table 82).

Operating expenditures on environmental protection rose from \$2,990 million in 1998 to \$3,836 million in 2004. Major contributors included the oil and gas extraction (16%); primary metals (15%); and pulp, paper, and paperboard mills (11%) industries (table 83).

Solid waste potentially contributes to changes in all three environmental sustainability indicators. For example, decomposing materials in landfills produce methane and liquid contaminants can sometimes leach into surrounding groundwater. Recycling and modern landfill technologies can reduce some of these impacts.

From 2002 to 2004, waste disposal increased 5% to 25.3 million tonnes. At the same time, waste diversion increased 18%, with 7.9 million tonnes of waste prepared for recycling in 2004, up from 6.6 million tonnes in 2002 (table 84).

Tables

- 82 Capital expenditures on environmental protection, by type of activity and industry
- 83 Operating expenditures on environmental protection, by type of activity and industry
- 84 Waste disposal and diversion, by province and territory

1. The disturbance area category refers to forest disturbance, which can be caused by changes in forest structure or composition resulting from natural events such as fire, flood or wind, from mortality caused by insect or disease outbreaks, or from human-caused events such as forest harvesting.

2. The other land cover area category consists of water, urban and built-up areas.

1. The disturbance area category refers to forest disturbance, which can be caused by changes in forest structure or composition resulting from natural events such as fire, flood or wind, from mortality caused by insect or disease outbreaks, or from human-caused events such as forest harvesting.

2. The other land cover area category consists of water, urban and built-up areas.

1. The disturbance area category refers to forest disturbance, which can be caused by changes in forest structure or composition resulting from natural events such as fire, flood or wind, from mortality caused by insect or disease outbreaks, or from human-caused events such as forest harvesting.

2. The other land cover area category consists of water, urban and built-up areas.

1. Cancer incidence rates are age-standardized using the direct method and the 1991 Canadian Census population structure. The use of a standard population results in more meaningful incidence rate comparisons, because it adjusts for variations in population age distributions over time and across geographic areas.
2. The Canada, provincial and territorial totals for all cancers diagnosed between 1976 and 1991 exclude approximately 197,500 cases of non-melanoma skin cancer (International Classification of Diseases, Ninth Revision (ICD-9 173)).
3. Rates for the Yukon Territory, the Northwest Territories and Nunavut should be interpreted with caution due to a small underlying count.

1. Life expectancy is the number of years a person would be expected to live, starting at birth (for life expectancy at birth) or at age 65 (for life expectancy at age 65) if the age- and sex-specific mortality rates for a given observation period (such as a calendar year) were held constant over the estimated life span.

Table 14
Households influenced by advisories of poor air quality, by province, 2005

	Were aware of an advisory of poor air quality ¹	Did not change routine or behaviour because of an air quality advisory ²
	percent	
Newfoundland and Labrador	F	F
Prince Edward Island	7	70
Nova Scotia	9	67
New Brunswick	14	59
Quebec	25	69
Ontario	56	56
Manitoba	8	57
Saskatchewan	5	71
Alberta	9	73
British Columbia	21	77
Canada	32	61

1. Households that were aware of an advisory of poor air quality in their area. Because these can be localized events, only a portion of a province's population may be in an area subject to an alert.

2. Percentage of households that were aware of a poor air quality advisory in their area and that did not change their routine or behaviour as a result of the advisory. The phrase "advisory of poor air quality" does not necessarily imply there was an official air quality advisory for the area.

1. Total utility and industry generation made by hydro (including tidal and wind), steam (conventional and nuclear), internal combustion and combustion turbine.
2. Electric power generated from a plant in which the turbine generators are driven by falling water. This is the sum of utility hydro generation and industrial hydro generation.
3. A plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler where fossil fuels are burned. This is the sum of utility conventional steam generation and industrial conventional steam generation.
4. Nuclear power is electricity generated at an electric power plant whose turbines are driven by steam generation in a reactor by heat from the fission of nuclear fuel.
5. A power plant in which the prime mover is an internal combustion engine. Electric power is generated by the rapid burning of a fuel-air mixture into mechanical energy. It is the sum of utility internal combustion generation and industrial internal combustion generation.
6. Generation from the conversion of heat energy as a gas into mechanical energy. This is the sum of utility combustion turbine generation and industrial combustion turbine generation.

1. Defined as the amount that was available for use in the Canadian economy. Includes the use of energy resources for non-energy purposes (for example, petrochemical feedstocks in fertilizer production). Excludes the use of wood and wastes as energy sources.

1. Defined as the amount that was available for use in the Canadian economy. Includes the use of energy resources for non-energy purposes (for example, petrochemical feedstocks in fertilizer production). Excludes the use of wood and wastes as energy sources.

1. Intensity of production is measured as direct plus indirect energy use per thousand dollars of production (in current dollars). Direct energy use is that associated with the industry's own production; indirect use is that associated with the production of the goods and services that are used by the industry.

Natural gas distribution, water and other systems	5,442	5,449	4,700	4,666	4,430	4,308	4,423
Residential building construction	1,092	1,293	1,160	1,175	1,253	1,336	1,573
Non-residential building construction	908	955	927	1,129	1,102	1,013	1,175
Transportation engineering construction	2,427	2,513	2,162	2,087	2,048	3,418	3,380
Oil and gas engineering construction	1,309	1,605	1,439	1,428	1,743	1,648	1,448
Electric power engineering construction	236	153	113	91	113	112	137
Communication engineering construction	109	95	59	89	86	55	49
Other engineering construction	152	90	64	62	74	60	65
Repair construction	1,127	1,276	1,104	1,120	1,230	1,258	1,386
Other activities of the construction industry	318	364	294	270	261	480	463
Animal food manufacturing	386	328	317	305	373	282	232
Sugar and confectionery product manufacturing	384	336	384	373	362	259	282
Fruit and vegetable preserving and specialty food manufacturing	611	594	601	493	679	678	606
Dairy product manufacturing	556	488	548	550	525	544	531
Meat product manufacturing	686	611	602	643	752	815	690
Seafood product preparation and packaging	147	104	123	126	160	146	93
Miscellaneous food manufacturing	1,576	1,458	1,303	1,233	1,351	1,198	1,167
Soft-drink and ice manufacturing	153	178	203	175	140	125	105
Breweries	277	266	256	259	281	282	288
Wineries	14	12	12	15	12	10	18
Distilleries	199	159	173	239	212	199	189
Tobacco manufacturing	38	35	32	30	29	31	27
Textile and textile product mills	564	533	640	571	538	524	456
Clothing manufacturing	204	151	163	153	265	209	159
Leather and allied product manufacturing	39	43	43	43	40	37	37
Wood product manufacturing	2,438	2,381	2,403	2,348	2,410	2,463	2,446
Pulp, paper and paperboard mills	12,859	12,462	11,480	11,480	11,237	9,992	9,256
Converted paper products manufacturing	436	451	437	388	405	606	554
Printing and related support activities	364	274	266	248	349	343	315
Petroleum and coal products manufacturing	22,819	21,754	22,829	23,168	22,108	22,282	25,981
Basic chemical manufacturing	9,683	12,236	9,076	8,934	8,370	6,980	6,117
Resin, synthetic rubber, and artificial and synthetic fibres and filaments manufacturing	13,118	10,595	6,348	3,389	2,546	2,306	2,587
Pesticides, fertilizer and other agricultural chemical manufacturing	9,631	10,281	10,123	10,481	10,556	9,545	9,500
Pharmaceutical and medicine manufacturing	127	157	246	122	156	143	152
Miscellaneous chemical product manufacturing	782	680	1,065	591	622	502	462
Plastics product manufacturing	534	503	522	428	555	515	505
Rubber product manufacturing	316	399	442	483	447	414	427
Cement and concrete product manufacturing	10,401	10,477	10,718	11,156	11,205	10,963	11,371
Miscellaneous non-metallic mineral product manufacturing	4,702	4,907	4,755	5,103	4,796	4,439	4,408
Primary metal manufacturing	24,281	24,601	25,654	25,163	24,742	24,378	23,607
Fabricated metal product manufacturing	1,714	1,586	1,484	1,411	1,537	1,665	1,712
Machinery manufacturing	760	772	625	576	627	684	576
Computer and peripheral equipment manufacturing	15	19	22	18	22	15	12
Electronic product manufacturing	142	145	185	124	143	90	84
Household appliance manufacturing	65	57	63	56	56	47	44
Electrical equipment and component manufacturing	375	353	301	236	224	207	191
Motor vehicle manufacturing	1,050	1,155	1,363	1,204	1,202	1,024	1,072
Motor vehicle body and trailer manufacturing	103	87	99	77	114	64	66
Motor vehicle parts manufacturing	809	797	646	652	768	773	874
Aerospace product and parts manufacturing	207	184	212	159	157	186	143
Railroad rolling stock manufacturing	91	62	92	90	68	95	54
Ship and boat building	50	55	43	31	39	36	23
Other transportation equipment manufacturing	13	29	27	11	19	14	13
Furniture and related product manufacturing	358	281	266	285	384	434	392

See footnotes at the end of the table.

Table 33-2 – continued

Greenhouse gas emissions,¹ by sector — 1996 to 2002

	1996	1997	1998	1999	2000	2001	2002
	kilotonnes						
Miscellaneous manufacturing	199	158	223	235	258	283	279
Wholesale trade	10,509	10,746	11,833	14,006	16,217	15,414	14,689
Retail trade	8,839	9,330	8,976	10,390	11,292	10,376	10,155
Air transportation	13,875	14,320	15,653	15,593	15,428	14,960	13,454
Rail transportation	6,519	7,177	6,798	6,302	6,239	6,222	6,294
Water transportation	3,207	3,789	3,755	3,588	3,850	3,447	3,273
Truck transportation	17,859	19,262	18,877	19,921	19,251	20,573	19,479
Transit and ground passenger transportation	3,235	2,657	2,924	2,698	2,795	2,481	2,580
Pipeline transportation	17,718	17,890	17,622	17,741	16,709	15,837	16,468
Scenic and sightseeing transportation and support activities for transport	1,366	1,084	858	893	789	739	946
Postal service and couriers and messengers	1,164	1,124	1,212	1,280	1,230	1,188	1,244
Warehousing and storage	232	308	258	232	218	205	239
Motion picture and sound recording industries	843	915	815	785	675	548	550
Radio and television broadcasting	41	47	49	42	33	34	38
Pay television, specialty television and program distribution and telecommunications	1,272	830	881	749	784	760	736
Publishing industries, information services and data processing service	101	71	197	140	129	117	125
Monetary authorities and depository credit intermediation	918	1,483	1,494	1,441	1,704	1,744	2,281
Insurance carriers	274	299	273	149	125	118	143
Lessors of real estate	6,859	5,752	6,146	6,564	8,229	8,161	11,578
Owner-occupied dwellings
Rental and leasing services and lessors of non-financial intangible associations	1,223	1,073	1,774	1,624	1,716	1,518	1,461
Other finance, insurance and real estate and management of companies	2,752	2,705	2,751	2,898	2,947	2,866	3,463
Advertising and related services	168	214	212	216	212	186	170
Architectural, engineering, legal and accounting services	476	871	843	933	914	776	767
Other professional, scientific and technical services	519	714	615	1,113	1,178	959	1,062
Administrative and support services	878	1,036	1,191	1,731	1,761	1,688	1,812
Waste management and remediation services	1,081	1,292	1,401	1,023	1,313	1,355	1,408
Educational services (except universities)	198	252	579	745	575	356	481
Health care services (except hospitals) and social assistance	1,196	1,364	1,245	1,248	1,522	1,497	1,387
Arts, entertainment and recreation	290	324	326	348	349	368	440
Accommodation and food services	2,271	2,829	2,616	2,464	2,282	2,160	2,499
Repair and maintenance	1,194	1,038	1,597	1,868	1,909	1,897	2,037
Grant-making, civic, and professional and similar organizations	77	60	31	33	11	11	11
Personal and laundry services and private households	692	863	720	696	615	563	583

1. Carbon dioxide equivalent emissions are estimated using global warming potentials for methane and nitrous oxide of 21 and 310 respectively.
2. Emission sources included in these estimates: combustion of fossil fuels; non-combustion uses of fossil fuels; industrial processes; agricultural soils; livestock manure and enteric fermentation. Emissions from prescribed burning in the forestry industry and from waste management are excluded.
3. Intensity of production is measured as direct plus indirect greenhouse gas emissions per thousand dollars of production (in current dollars). Direct emissions are those associated with the industry's own production; indirect emissions are those associated with the production of the goods and services that are used by the industry.

1. Total amount of non-hazardous waste disposed of in public and private waste disposal facilities. This includes waste that is exported out of the source province or out of the country for disposal. This does not include wastes disposed in hazardous waste disposal facilities, wastes managed by the waste generator on site or waste materials that are taken directly from the point of generation to the end user (e.g., cardboard generated by a retail outlet and shipped directly to a pulp and paper facility).

2. This information covers only those companies and local waste management organizations that reported non-hazardous recyclable material preparation activities and refers only to that material entering the waste stream and do not cover any waste that may be managed on-site by a company or household. Additionally, these data do not include those materials transported by the generator directly to secondary processors such as pulp and paper mills while bypassing entirely any firm or local government involved in waste management activities.

3. These data are derived from a survey administered by RECYC-QUÉBEC.

Note(s): Figures may not add up to totals due to rounding.

Major drainage area and sub-drainage area geography

Hydrologists identify eleven major drainage areas in Canada and 164 sub-drainage areas. The complete drainage area framework can be obtained from **Natural Resources Canada**. Descriptions of each of the drainage areas follow.

Major drainage area descriptions

The **Maritime Provinces** drainage area covers New Brunswick, Prince Edward Island, Nova Scotia and part of the Gaspé Peninsula in eastern Quebec. This area drains into the Gulf of St. Lawrence and the Atlantic Ocean. Halifax, Fredericton and Charlottetown are located in this drainage area.

The **St. Lawrence** drainage area includes all of southern Quebec, southern Ontario and Newfoundland. Cities in this drainage area include Montreal, Toronto, Ottawa and Thunder Bay in Ontario and St. John's and Corner Brook in Newfoundland.

The **Northern Quebec and Labrador** drainage area covers all the area just north of the St. Lawrence drainage area. Most of the water in this drainage area drains into Hudson, James and Ungava bays. The Labrador portion of the drainage area drains directly into the Atlantic Ocean. Communities in this drainage area include Chibougamau and Kuujuaq in Quebec and Happy Valley–Goose Bay in Labrador.

The **Southwestern Hudson Bay** drainage area covers a large portion of northern Ontario, a small part of western Quebec and northeastern Manitoba. Communities in this drainage area include Val-d'Or in Quebec and Kapuskasing and Timmins in Ontario.

The **Nelson River** drainage area covers most of the southern Prairie provinces, from the Rockies to northwestern Ontario. Major cities within this drainage area are Winnipeg, Regina, Saskatoon, Calgary and Edmonton. Water from the Nelson River drainage area ultimately drains into Hudson Bay.

The **Western and Northern Hudson Bay** drainage area includes parts of eastern Alberta, all of the middle portions of Saskatchewan, northeastern Manitoba, the northeastern portion of the Northwest Territories, southeastern Nunavut, the Hudson Bay islands and part of Baffin Island. The following communities are found in this drainage area: Bonnyville, Alberta; La Ronge, Saskatchewan; and Rankin Inlet, Nunavut.

The **Great Slave Lake** drainage area is composed of northern Alberta, northern Saskatchewan, southern Northwest Territories and a small portion of British Columbia. Cities within this watershed are Grande Prairie and High Level in Alberta, Yellowknife and Hay River in the Northwest Territories, and Fort St. John in British Columbia.

The **Pacific** drainage area includes all the area that is west of the continental divide, representing about 70% of the province of British Columbia. The southwestern part of the Yukon is also part of this drainage area. Some of the communities in the eastern portion of the drainage area are Kimberley, Golden and Invermere, all in British Columbia. Cities in the western portion include Vancouver, Victoria, Abbotsford and Whistler. Terrace and Prince Rupert in British Columbia are among the northern communities in this drainage area.

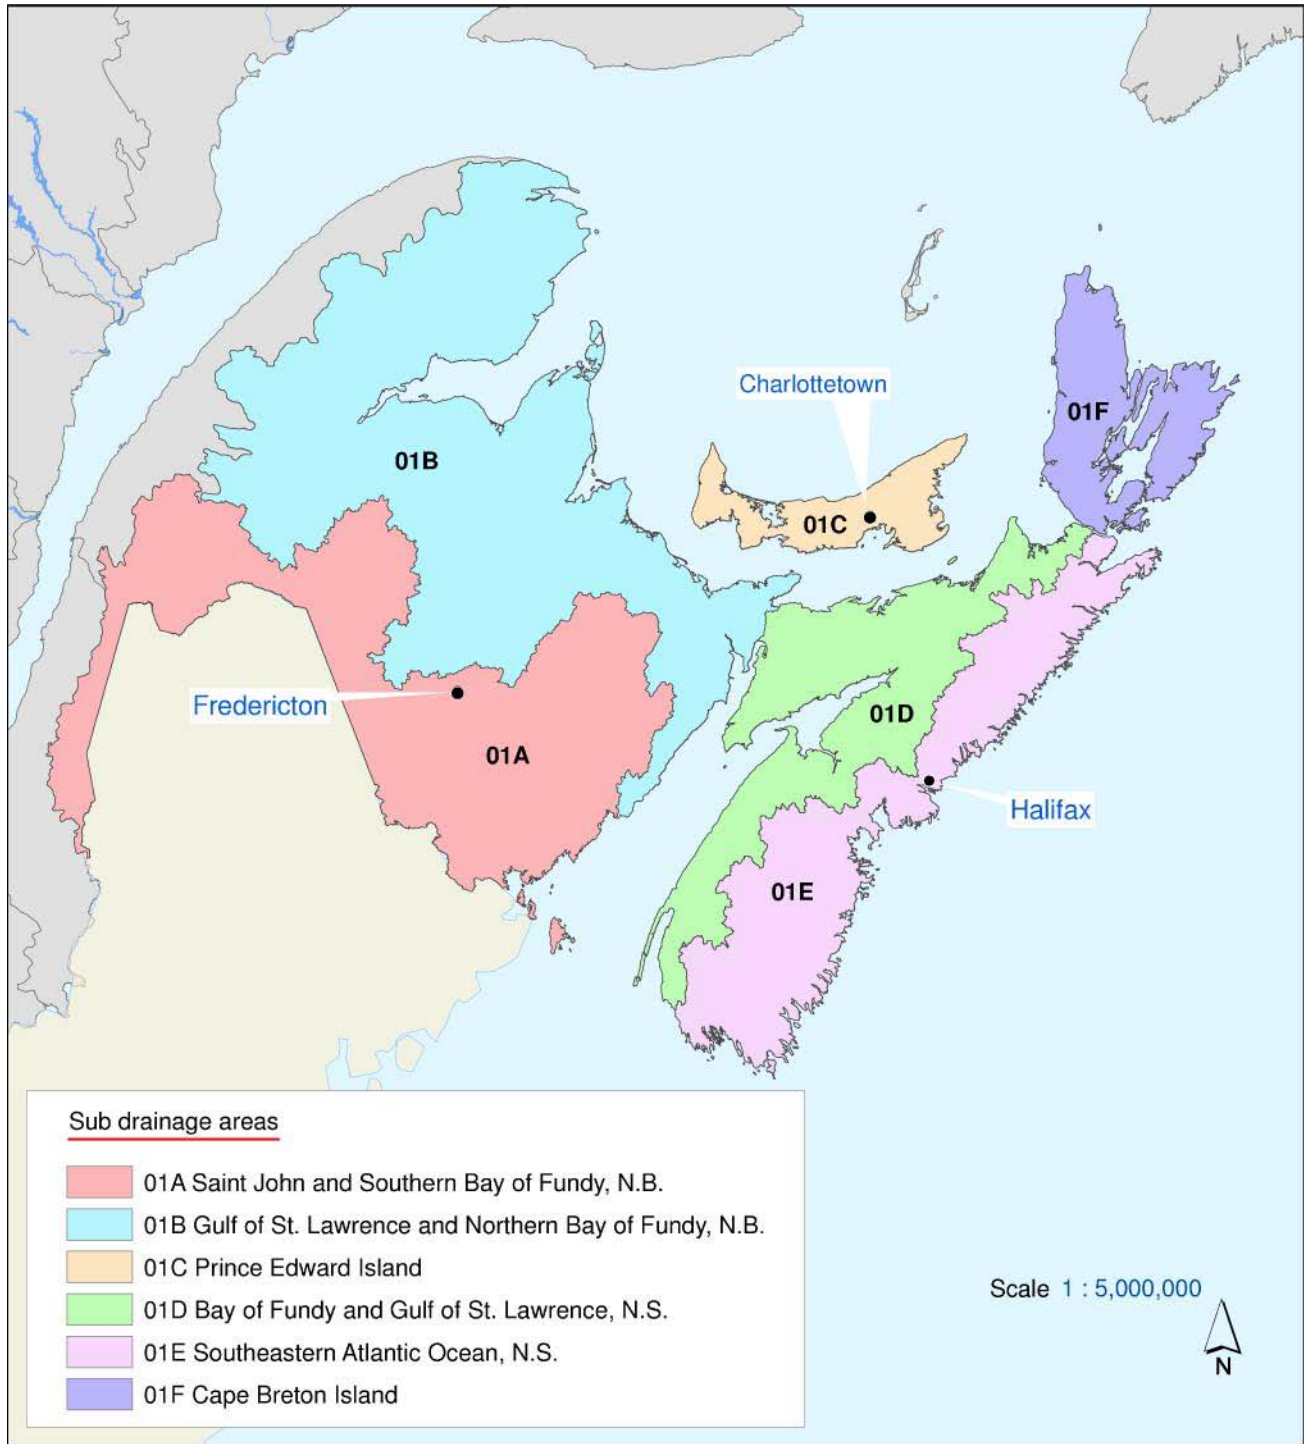

The **Yukon River** drainage area contains most of the western portion of the Yukon territory. The most southerly portion of this drainage area is in British Columbia. Communities and cities in this drainage area are Whitehorse, Dawson and Old Crow in the Yukon. The Yukon River flows through central Alaska, and ultimately into the Bering Sea.

The **Arctic** drainage area, the largest of all drainage areas in Canada, covers most of the arctic islands and large portions of the Northwest Territories, Nunavut, the Yukon Territory and, to a lesser extent, British Columbia and

Alberta. Communities within this drainage area include Inuvik in the Northwest Territories, Fort Nelson in British Columbia, and Pangnirtung, Iqualuit and Resolute Bay in Nunavut.

Finally, the **Mississippi** drainage area covers a small area in the southernmost parts of Alberta and Saskatchewan.
